DIAGNOSTICS

3GL (Lab Analysis + Resting Test by PNOE + Assessment)

45' / 237€

3GL plus Urine Test 45' / 410€

Euphoria Retreat has worked in collaboration with Eucrasia, an innovative Greek company, Global awarded, in the field of Health Tourism to devise our signature approach to personalized nutrition. We have developed a unique protocol to assess the three most important biomarkers for metabolic health: glucose, glutathione (the body's two main endogenous antioxidants) and glycogen. We measure glucose and glutathione from a few drops of blood. A capillary ergometric scanning indirectly calculates glycogen efficiency. With a urine sample we measure more than 12 active metabolites and metabolically significant amino acids. We call this 3GL Plus, a method that promotes metabolic resetting by a unique and comprehensive Medical-Nutrition-Exercise program to re- store and maintain metabolic balance. This information forms the basis of our nutritional approach for each of our guests on our programs.

Urine Test

173€

Interpretation of the metabolomics test which is performed in urine sample. The metabolomics test aimed to detect the most important amino acids in urine which are the final products of excretion of particularly important biochemical processes of metabolism. This analysis of amino acids is performed using High Pressure Liquid Chromatography. The test provides important information about adequacy of dietary protein and various system dysfunctions such as digestive, mood and sleep disorders. These results in combination with the other tests performed, contribute in providing an in-depth picture of the metabolic process and significant help to access both the current metabolic profile and general health state.

Glutathione Test

15' / 74€

Glutathione molecule (GSH) is the primary antioxidant mechanism and the most abundant thiol in human blood and tissues; therefore, it can be considered as our most important cellular protector. Glutathione reduces the levels of reactive oxygen species (ROS) and is involved in the recycling of antioxidant molecules within the cell. It plays a key role in the redox status of the organism, regulating the antioxidant homeostasis of organisms.

Body Bio-impedance Analysis

15' / 84€

Analysis of the body composition. This is a method used for estimating body fat composition. More specifically, body fat, muscle mass and total body water can be estimated by a weak electric current which flows through the body and the voltage is measured to calculate impedance (resistance) of the body. In addition, it can provide information about minerals and protein which can be very useful for weight management.

Respiratory Equilibrium (Resting test by PNOE)

15' / 110€

During a PNOE test, you'll typically follow these steps:

Resting Baseline: You start by sitting or lying down comfortably. The PNOE device measures your resting metabolic rate (RMR) by analyzing your breath. RMR reflects the energy your body needs at rest.

Gas Exchange Analysis: The PNOE system continuously monitors your oxygen uptake (VO_2), carbon dioxide production (VCO_2), and respiratory exchange ratio (RER). These values provide insights into your metabolism and energy expenditure during exercise.

Heart Rate Monitoring: Your heart rate is also tracked during the test. This information helps correlate physiological responses with exercise intensity.

Data Collection: The PNOE system records data throughout the test. It calculates your fat-burning efficiency, aerobic capacity, and other relevant metrics.

Customized Insights: Based on the collected data, the PNOE software generates personalized recommendations. These may include optimal exercise intensity, nutrition adjustments, and recovery strategies.

Ergo Physiological Scanning (Active test by PNOE)

20' / 231€

This scanning device assesses key physiological parameters such as cardio-respiratory function, fat burning efficiency, metabolic health and muscle composition, while you exercise. This evaluation helps generate your most efficient exercise plan for your particular needs.

Biofeedback Profiling with QEST 4

With Wellness Consultation 55' / 173€

With Medical Consultation 55' / 263€

Biophysics shows that all cells resonate at different frequencies and can transmit and receive electromagnetic energy. Communication between cells plays a big part in the function of all body systems. Healthy and unhealthy cells have very different resonant frequencies. Stress, fungi, bacteria, toxins, hormonal imbalances and viruses can all affect electromagnetic response and resonance at the cellular level. They can interfere with proper absorption and metabolism of nutrients, which in turn can lead to allergies, inflammation and disease. Qest 4 is the most advanced, flexible and user friendly bioenergetic testing that scans the electromagnetic signatures emitted by organs, tissues and cells. There is a wide variety of test signatures that

cover points relating to internal organs, food preferences, environmental contaminants, nutritional factors, toxins, emotional patterns, vitamin deficiencies and many more.
